2 recalls listed by Transport Canada for this model year

Powertrain

2015401 14 Sep 2015

On certain vehicles equipped with a CVT transmission, the drive pulley shaft could be subjected to high stress during certain operation modes. During the manufacturing of the drive pulley shaft, some parts may have been produced at the lower end of the hardness specification. If shafts with lower hardness are repeatedly subjected to the specific high pressure modes, it could result in the shaft breaking during operation. If the drive pulley shaft were to break, it could result in a loss of propulsion or the front wheels locking up while driving, which would increase the risk of a crash causing property damage and/or personal injury. Correction: Dealers will install a CVT software update that contains a stress reduction program.

Tires

2014074 10 Mar 2014

On certain vehicles, tires may have been damaged during the mounting process, resulting in a tear in the bead of the tire. This could result in rapid air loss and/or tire failure, which could increase the risk of a crash causing injury and/or property damage. Correction: Dealers will inspect tires and replace as necessary.
